Ideal for creative  
Interior Design

SGG EMALIT

Glass makes spaces light, airy and more spacious than the sober technology suggests – while glass allows daylight from windows to penetrate deep into rooms.

Architects and designers are more often discovering ways of employing glass for interior applications, using its transparency and particular aesthetic qualities in addition to the enormous potential for design. The architectural play with colour, surface reflections and light accentuates spaces and their function.

EMALIT and SERALIT are ideal for creative interior design. Both products are colourfast, light- and weather-resistant, resistant to temperature fluctuations and maintenance-free.

EMALIT is an enameled, tempered safety glass in accordance to EN 12150 and is normally produced using simple enamelling. The enamel coating is applied to the glass surface using rollers. EMALIT is therefore designated for use when viewed from outside (glass surface) against a dark background. If the glass is to be bonded to a substrate we recommend ordering a thicker coating (casting coat).

The standard colour chart encompasses a choice of 50 colour tones – 32 of which use environmentally-friendly lead-free paint. Samples as well as orders are therefore easily accommodated. Custom colours are also possible – the cost of colour-matching is to be taken into account. A definite decision to place an order for production, particularly with metallic and non-standard colours, should only be made once an original sample has been seen. In specific cases we recommend a full-size mock-up in realistic conditions.

# SGG EMALIT Applications

Facades . Wall-cladding (also in wet-rooms) . Sanitary areas  
Kitchens . Swimming pools . Laboratories . Furniture

EMALIT is not suitable for vision areas.

# SGG EMALIT Glass Types

## SGG EMALIT

The base material Float glass SGG-PLANILUX influences the actual appearance of the colour with the characteristic self-colour of the glass.

## SGG EMALIT EXTRA BLANC

Here SGG PLANLUX DIAMANT is used as the base glass, a special, decolorized, extra-white Float glass with very low iron oxide content. The optical brilliance of colour rendition is outstanding.

## SGG EMALIT CONTRAST

The design glasses SGG MASTERCARRE and SGG MASTERPOINT are used as basis glass. See SGG EMALIT for colour palette and technical description. The sleek geometrical relief patterns produce interesting reflections and light refractions dependent on the angle of viewing and light incidence.

## SGG EMALIT SATINOVO

SGG SATINOVO is used as basis glass which is a Float glass completely etched on the viewing surface. See EMALIT for colour palette and technical description. SGG EMALIT SATINOVO creates a completely new kind of tactile material, which is enlivened by its appearance and colour rendition.

## SGG EMALIT METALL

A special pigmentation in the enamel gives a metallic effect. It gives the glass a lively, more or less glittering appearance, depending on the light incidence and lighting conditions.

Attractive  
partial transparency

SGG SERALIT

The use of SGG SERALIT in living and working spaces brings atmosphere and ambience - the partial coating allows daylight through into rooms whilst visibility from outside is apparently restricted.

The standard designs encompass a choice of 35 patterns. Samples and orders are therefore quickly and easily administered. The standard colour is white - but generally all Emalit Standard colours and custom designs possible to produce. The costs for colour-matching and setting-up of printing equipment is to be taken account of.

Artists discover the material glass and develop together with Eckelt motifs for screen-printing. Completely new applications of art on glass have become possible.

Examples of standard designs can be viewed on our website [www.eckelt.at](http://www.eckelt.at) (under "eckelt.ARTE") or in our showroom GLASINFORM in Vienna.

# SGG SERALIT Applications

Facades . Wall-claddings . Skylights . Revolving doors  
Sliding doors . Glass walls . Balustrades . Partitions  
Shower enclosures . Table tops . Showcases

# SGG SERALIT Glass Types

## SGG SERALIT LITEX

Is a partially enameled tempered safety glass in accordance with EN 12150. An attractive partial transparency is achieved by using the Litex Standard designs, whereby the decorative effect can be enhanced depending on the design and colour. It is also possible to produce custom designs. The glass substrate can be either Float, Planilux Diamant or Satinovo.

Attractive design possibilities are achievable when the completely coated substrate of SGG MIRASTAR-Chrome mirror is used in combination with SGG SERALIT LITEX.

## SGG SERALIT TRANSPARENT

The special coating of transparent enamel is usually applied over the complete surface. With SGG SERALIT-TRANSPARENT standard colours it is possible to achieve extremely homogenous pastel tones. Through the ambivalence between transparency and translucency a completely new aesthetic appearance is created which is characterized through soft contours and imaginable boundaries.

## SGG SERALIT OPAK

The rendition of given lines, dots, areas or artistic designs in up to five different colours within one sheet of glass is possible. Standard and custom colours can find their use. A completely coated coloured background provides SGG SERALIT OPAK with a three-dimensional, structured appearance. As a glass substrate either Float, Planilux Diamant or Satinovo can be used.

# SGG SERALIT LITEX Standard Collection

Stock samples are available in white, but all EMALIT standard colours can be produced. The costs for colour-matching and setting-up of printing equipment is to be taken account of when using small amounts.

The patterns marked with \* can be printed either vertically or horizontally.

The patterns are shown full-scale (except Nr. 562 and Nr. 1291)

## Production information

### HEAT-SOAK-TEST

Is generally recommended for building safety. Most Standards for overhead or sloped glazing applications require Heat-Soak-Testing to be carried out – we also recommend it for spandrels, guarding glass, balustrades, point-fixed glazing and all cast glass as well as coloured or (partially) enameled glass.

Should a Heat-Soak-Test be ordered without any specification, we will carry it out in controlled conditions in accordance with prEN 14179-1 with 4 hours holding time.

### EDGE QUALITY

Generally EMALIT and SERALIT will have all straight edges fine ground. Corner and rounded cut-outs as well as non-rectangular units will be arised.

### COLOUR AND PRINT TOLERANCES

Slight colour differences may occur between samples and actual project deliveries as the self-colour of the glass, its thickness and surface structure influence colour appearance resp. may appear different with each colour. Colour differences between samples and actual deliveries do not constitute grounds for any claim.

Dependent on the process involved, EMALIT may be subject to pinholes, stripes or clouding when backlit (therefore designated for use with a dark background). Irregular colour overrun on the edges is unavoidable and cannot be deemed as defective quality.

Please read the "Guidelines for Evaluating the Visual Quality of enameled and screen-printed glass" under [www.eckelt.at / downloads](http://www.eckelt.at/downloads)

### DIMENSIONS

Dependent on the glass thickness  
 SGG EMALIT: max. 1800 x 4700 mm  
 SGG SERALIT: max. 2000 x 4000 mm
